Vultr Agent Rush · Blast Radius Zero

FOR SHOP OPERATORS, BOOKKEEPERS AND PEOPLE MANAGING EXPORTED RECORDS

Undo the bad import. Keep the work done afterward.

Wrong prices were imported. New invoices arrived, payments were recorded, and a few prices were edited again. A whole-backup rollback would erase that work.

117
damaged prices restored

127
current records retained

23
payment and price updates protected

Shopify warns that product CSV imports cannot be canceled once started, included blank fields can overwrite values, and backups matter.

EXECUTED INVESTIGATION, PRECISE APPROVAL, INDEPENDENT VERIFICATION

The agent investigates. You approve the cells.

1. Inspect versions

Good copy, incident checkpoint and today’s file are read by **trusted gVisor workers on Vultr**.

2. Investigate

Vultr Inference writes diagnostic code. It runs in its own sandbox and compares the actual files.

3. Review the scope

The controller validates the proposed cells and protects observed later edits. **The operator approves the exact plan.**

4. Generate the repair

A second Vultr call writes the approved recovery. Each key-and-field pair is explicit.

5. Execute on copies

The repair runs in **another gVisor container**. Originals stay read-only and unchanged.

6. Verify and export

A fresh trusted worker inspects the result. **Every cell and all teardown checks must pass** before download.

The model receives the incident description, structure and aggregate findings. Snapshot contents and extracted record values stay outside inference requests. Generated code never receives the acceptance answers.

Vultr VM + Serverless Inference · At most two model calls per workspace

Human review binds fingerprints, exact cells and workspace version

UNDO THE MISTAKE WITHOUT RESETTING LATER EDITS

Three prices changed again. Those stay.

120 prices changed in the import. Only 117 still have the imported value.
The three overlapping edits keep today’s value.

RECORD	GOOD VERSION	AFTER THE IMPORT	TODAY’S VALUE · KEPT
INV-0003	$28.75	$2875.00	**$31.00** ✓
INV-0042	$77.50	$7750.00	**$79.00** ✓
INV-0088	$135.00	$13500.00	**$137.50** ✓

7
new records retained

20
payment updates retained

3
later price edits retained

Snapshots show observed differences; they cannot establish a complete edit history.

Two-version files use manual cell selection.

REAL WORK CONTAINED ON VULTR, WITH OUTPUT YOU CAN CHECK

A failed program gets stopped. A repair gets checked.

```
def recover(a, b, c, d):
    while True:
        pass
```

2 seconds

Separate runaway-code probe on Vultr.
Deadline enforced. Container removal confirmed.

- ✓ Executed diagnosis and recovery
- ✓ Correct approved replacements
- ✓ Every other value unchanged
- ✓ Same records and CSV order
- ✓ Original files unchanged
- ✓ Every temporary sandbox removed

gVisor · no network · read-only inputs · nonroot
192 MiB RAM · 0.5 CPU · 48 PIDs · bounded output
Eight-second execution limit for ordinary worker runs

CSV + SQLite · 1,000 records · 256 KiB per file
No account or email needed to try the live app.
